

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Friday 31/01/2025

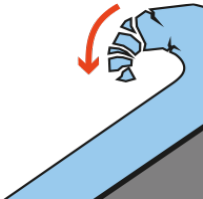

Avalanche Problems

Wind Slab

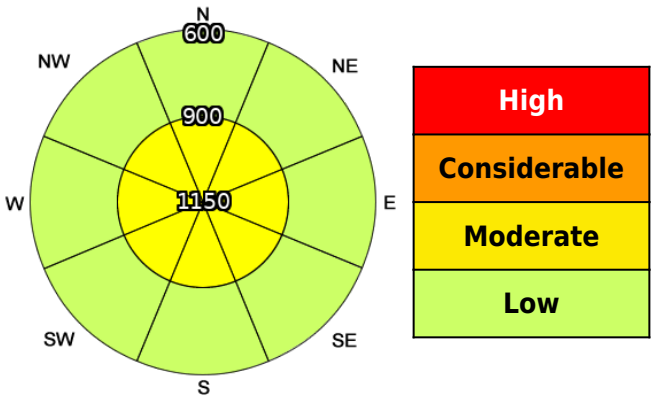

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Initially, areas of unstable windslab will be present above 900 metres in many steep wind sheltered locations, particularly around gully tops and corrie rims. Later, as freezing levels rise, minor surface wet snow instabilities may be possible on steep terrain above 800 metres. Cornice collapse and falling ice possible later in the day. Many ridges will be snow free. The avalanche hazard will be Moderate.

Forecast Weather Influences

Light snowfall overnight, dry thereafter. Freezing levels will rise throughout the day, expected to be just above the summits by the end of the afternoon. Winds will be mixed directions from the Southerly quadrants. A strong breeze overnight from the South-South-East before easing, some fluctuation but mostly South-South-West for the day.

Comments

A mix of avalanche hazards with new snow initially before thawing in the afternoon.
