

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Friday 14/02/2025

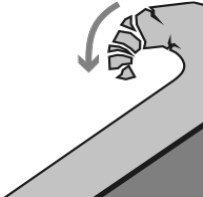

Avalanche Problems

Wind Slab

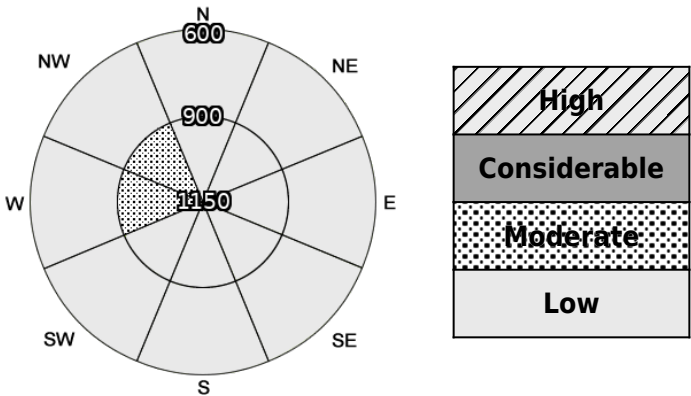

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

Instabilities within the snowpack will persist on West and North-West aspects above 900 metres. Areas most affected will be coire rims, gully tops and other steep wind sheltered locations, especially where accumulations have gained depth. The old snowpack will be icy, firm and stable. Cornices will be found on West to North aspects and remain a threat from collapse. Wind exposed terrain will be mainly scoured. The avalanche hazard will be Moderate.

Forecast Weather Influences

Some patchy light snow showers possible overnight and through the day but minimal amounts expected. Fresh East-South-Easterlies will veer South-South-Easterly and increase to strong in the early hours. The freezing level will be at 200 meters, with the exception of a few hours overnight where it will rise to 400 metres.

Comments

Around mid mountain level, a layer of unconsolidated snow is present, varying in depth - having potential to be redistributed if the wind speed increases. The weather stand off looks like it's coming to an end with snowfall expected overnight Friday.
