

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Tuesday 18/02/2025

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

A light covering of snow is expected on the highest summits during the morning especially over coastal ranges. Though uncertain, amounts are not thought to be significant, landing mainly on bare ground and thawing quickly in the following rain. The existing patchy snowpack, mainly inland on Northerly and Easterly aspects above 750 metres, will initially soften only slightly and will remain stable. Hanging ice will be prone to collapse. The avalanche hazard will be Low.

Forecast Weather Influences

A mainly dry night with a period of precipitation during the morning, initially falling as snow and then rain as the freezing level rises above the summits. Winds will be generally light to moderate from a South-Easterly direction, strengthening slightly during the morning. The freezing level is expected to be well above the summits by the end of the day.

Comments

Amounts of snow and rain are uncertain, if more significant, the hazard should be adjusted accordingly. Icy patches will remain. Hanging ice will be prone to collapse.
