

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Tuesday 25/02/2025

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Shallow and generally avoidable accumulations of fresh windslab will develop through the forecast period on North to East aspects above 900 metres. Steep, wind sheltered locations such as gully tops and coire rims being most affected. Small cornices will start to build on these same aspects. The existing, older snowpack mostly on North-West to North-East aspects will be well consolidated and stable throughout, becoming firm and icy through the day. The avalanche hazard will be Low.

Forecast Weather Influences

Winds will be gale force South-Westerlies later veering and easing to become very strong West-South-Westerlies. The freezing level will be around 900 metres, with isolated snow showers throughout the forecast period.

Comments

Existing older snow patches will become firm and icy as the freezing level lowers. Serious consequences for any trips and slips.
