

THE AVALANCHE HAZARD WILL BE LOW**Avalanche Hazard Forecast for Tuesday 25/02/2025****Avalanche Problems****Wind Slab****Cornices****Forecast Snow Stability & Avalanche Hazard**

Unstable windslab will develop throughout the period mainly on steep wind sheltered North to East aspects above 750 metres. Amounts are not expected to be significant, but deeper deposits, particularly on inland mountains and at higher elevations will contain weaknesses. Coire rims and gully tops will be most affected. Fresh unstable cornices will begin to develop above these aspects. Southerly to Westerly aspects will be generally scoured and stable. The avalanche hazard will be Low.

**Forecast Weather Influences**

There will be frequent showers throughout the period, these being of snow above 750 metres. Very strong South-Westerly winds overnight will moderate to Strong through Tuesday, and veer to West-South-Westerly. Freezing level will be around 750 metres slowly falling towards 600 metres at dusk.

Comments

Little change during the day today. The sleet falling at summit level did not settle on the relatively warm ground. Some fresh snow is expected over the summits during this evening and tomorrow, particularly on inland mountains, as the freezing level creeps lower down the hill.
