

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Friday 07/03/2025

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Scattered snow patches will remain on North to East aspects above 850 metres, mainly around coire rims on the more inland mountains. These snow patches will remain stable and well bonded. Elsewhere the hills will be largely snow free. The avalanche hazard will be Low.

Forecast Weather Influences

There will be some light rain through Thursday evening, to all levels, which will clear overnight to give a largely dry day on Friday. Gale force South-Westerly winds on the tops will ease steadily throughout the period, to light winds by Friday afternoon. Freezing level will be at or just above the highest summits.

Comments

Friday is generally settled with slightly cooler temperatures, the weekend looks mixed, with the best weather most likely on Sunday. Potentially a return to colder conditions in the hills early next week, but precipitation levels may be low with high pressure building through next week giving dry and bright conditions, perhaps cooler nights.
