

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Monday 10/03/2025

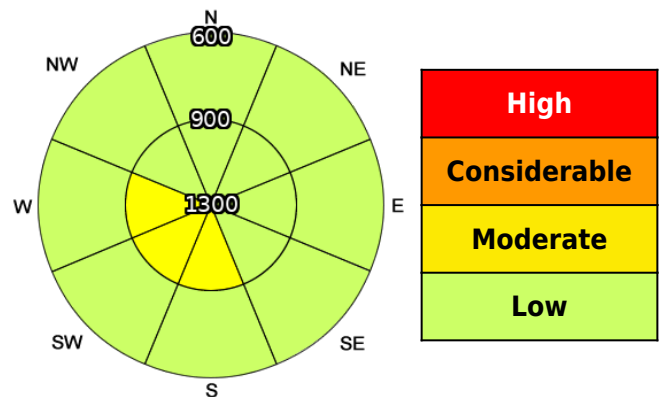

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

Fresh deposits of windslab will develop in steep wind sheltered locations mainly on South to West aspects mostly above 900 metres. Other aspects and lower elevations will also be affected due to cross loading and re-distribution. Instabilities will rapidly develop where these deposits gain depth or overlie the older re-frozen snowpack. Elsewhere the new snow will mostly fall on bare ground. The avalanche hazard will be Moderate.

Forecast Weather Influences

A dry evening is expected, later rain will quickly turn to heavy snow, easing to less frequent snow showers during the day. The freezing level will initially remain above the summits, lowering during the night to around 600 metres by early morning. North-Easterly winds will gain in strength to become gale force by early morning, remaining at this strength for the rest of the forecast period.

Comments

A cold front from the North will cross Scotland during the night bringing a return to cold and wintery conditions. There is also some uncertainty around the snow quantities expected with new snow falling possibly as low as 400 metres during the day.
