

Avalanche Hazard Forecast for Saturday 22/03/2025

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The remaining very patchy snowpack will continue to thaw and will remain stable in all locations. Greatest remaining snow lies on permanently shaded areas, mainly on steep North-West to North-East aspects above 800 metres.

There will be insufficient snow for an avalanche hazard and no further avalanche reports will be published for Torridon unless conditions change. For further information please refer to the SAIS mountain blog, which will continue.

Forecast Weather Influences

The freezing level will remain above all summits. Some light rain overnight, especially in the West of the area, then rain at all levels during the day. Winds will initially be gale force South-Easterly gradually easing through the period and during the afternoon be light and variable in direction.

Comments

Potentially, by the end of tomorrow, to all intents and purposes there will be practically no snow left in the Torridon area. After today, avalanche forecasts will cease unless conditions change, but the blogs will continue and for further information please refer to the SAIS mountain blog.
