

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Thursday 27/03/2025

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The remaining snow patches will continue to thaw and consolidate. The stability will be generally good, isolated surface instabilities will develop on steep terrain above 950 metres, coire rims and gully tops most affected. The main snow deposits remain on the higher mountains along the Northern boundary of the forecast area. The avalanche hazard will be Low.

Forecast Weather Influences

After a dry evening, showers falling as rain at all levels will develop during the night, becoming heavier and persistent through the day. South-Westerly winds will be very strong potentially strengthening to gale force during the afternoon. The freezing level will be above the summits.

Comments

Rain at all levels expected, heaviest during the daytime. Snow patches persist in steep terrain with serious and consequential runouts.
