

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Tuesday 01/04/2025

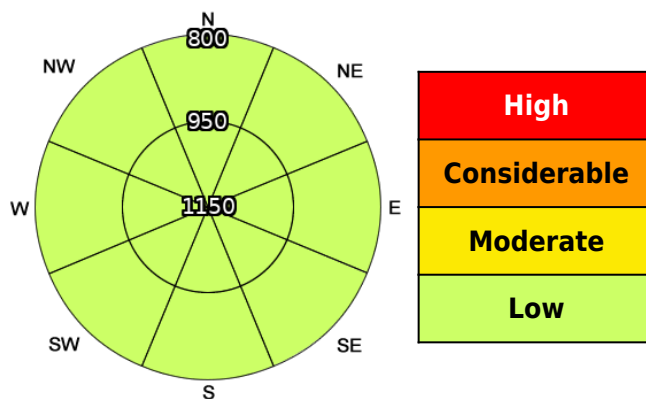

Avalanche Problems

Wet Snow

Forecast Snow Stability & Avalanche Hazard

The remaining snow patches will continue to thaw and consolidate and be stable. The greatest accumulations persist in steep terrain mostly on North-West to North-East aspects above 950 metres. Isolated wet snow instabilities will develop during the day on steep sun affected slopes with coire rims and gully tops being most affected. The avalanche hazard will be Low.

Forecast Weather Influences

The winds will be fresh Southerlies, gaining in strength to become very strong during the afternoon. Dry, with no precipitation expected and the freezing level will be above the highest summits.

Comments

Dominant high pressure bringing settle weather and warm temperatures.
