

Avalanche Hazard Forecast for Saturday 13/12/2025

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Overnight there are likely to be some new snow deposits, most of which will fall on bare ground. These will mainly be on North to East aspects above 900 metres. During the day, this new snow will become wet and thaw in the mild wet conditions. The old snowpack will be limited to small receding high altitude snow patches. This will be insufficient to warrant an avalanche hazard category. For further information please refer to the SAIS mountain blog.

Forecast Weather Influences

Gale force South-Westerly winds overnight will increase storm force during the day. Overnight showers are expected to fall as snow above around 900 metres. During the morning the freezing level will rise well above all summits and there will be persistent rain at all levels.

Comments

A mild wet windy weekend is in prospect.
