

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Saturday 20/12/2025

Avalanche Problems

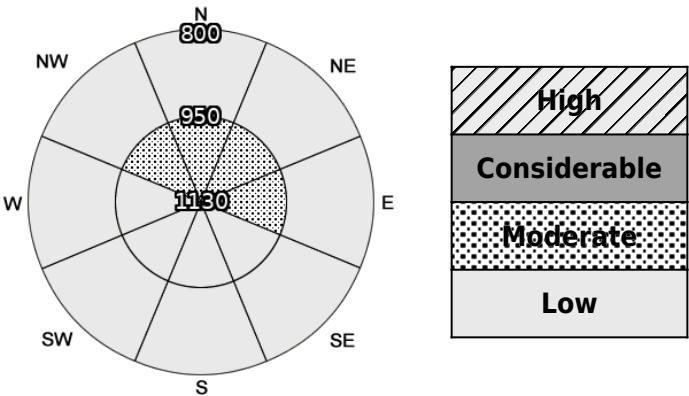

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Snow-cover will diminish at lower elevations with most accumulations remaining above 950m. Generally the snowpack here will begin to consolidate in the milder temperatures but some weaknesses will persist in the windslab where it achieves depth. Mostly present in wind sheltered locations around coire rims, gully tops and ridge flanks on North-West through North to Easterly aspects. On the same aspects, fragile cornices will be prone to collapse. The avalanche hazard will be Moderate

Forecast Weather Influences

Winds, strong South-Westerly overnight before backing South-Easterly during the day. Some light precipitation overnight thereafter it will be dry. Freezing level will be above the summits during the night before lowering to around 1000m in the afternoon.

Comments

A cover of fresh snow but thin and lying on bare ground mostly. Fluctuating temperatures will help consolidate deeper deposits.
