

## Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Sat 03/01/2026 TO 18:00HRS Sun 04/01/2026

**THE AVALANCHE HAZARD WILL BE MODERATE****Avalanche Hazard Forecast for Sunday 04/01/2026****Avalanche Problems**

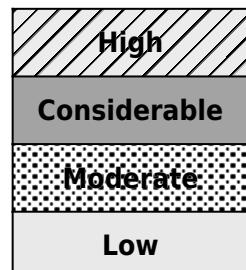

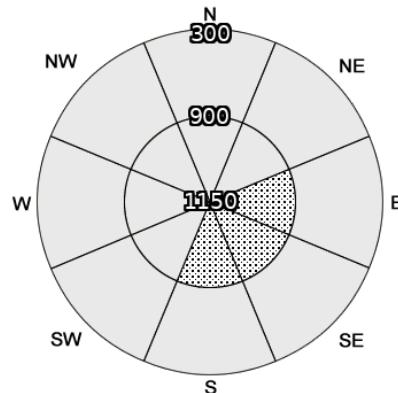

Wind Slab

Cornices

**Forecast Snow Stability & Avalanche Hazard**

Deposits of poorly bonded windslab will gain depth becoming more widespread through the period. Greatest accumulations in wind sheltered areas primarily on East to South aspects above 900 metres and should be avoidable. Most affected areas will be where windslab overlies the old frozen snowpack around gully tops, coire rims and ridge flanks. Below this level and on windward aspects stability will be better. Fragile cornices will also continue to form. The avalanche hazard will be Moderate.

**Forecast Weather Influences**

Freezing at most levels with a cold, showery North to North-Westerly airflow. Further snow showers these will be light during Saturday night becoming more frequent during the day accompanied by moderate to fresh North-Westerly winds.

**Comments**

Cold conditions are forecast to continue, windy over the high summits with more light snowfall. The snowpack should become more widespread.
