

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Tuesday 13/01/2026

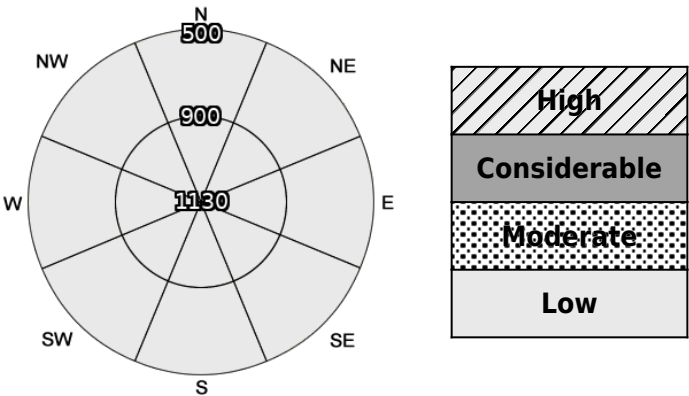

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

The current diminished and moist snowpack lying on most aspects above 600m will stabilise and refreeze. Some additional new snow will form shallow avoidable windslab deposits in wind sheltered locations on North - West through North to Easterly aspects above mostly 900m. Coire rims and gully tops mostly affected. The avalanche hazard will be Low

Forecast Weather Influences

The freezing level, around 900m overnight will lower through the early hours and the day to 600m. A dry night with some precipitation falling as snow above 400m from midday. Winds will be generally South-Westerly gale force overnight becoming light by daybreak then fresh to strong in the afternoon.

Comments

An improving situation from a stability point of view and a return to colder conditions. A diminished snowpack but still enough to present a winter scene.
