

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 03/02/2026

Avalanche Problems

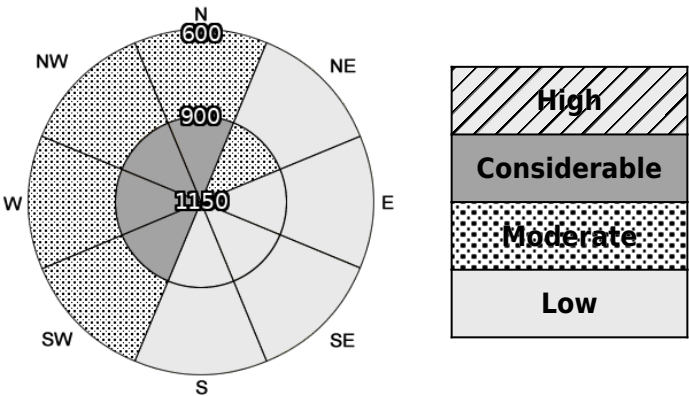

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Fresh deposits of unstable windslab will be present in wind sheltered locations on South-West through West to North aspects above 900 metres, The greatest instability will be in steep locations such as coire headwalls, gullies and convex shaped terrain. Unstable cornices will overhang these aspects. Between 500 and 900 metres, more localised instabilities will be present on steep banks and burn lines. Wind exposed slopes will be firm. The avalanche hazard will be Considerable.

Forecast Weather Influences

Very strong East-South-East winds during the evening will back Easterly overnight and persist for the remainder of the day. Precipitation throughout the forecast period will be heaviest overnight and into the morning, falling as snow initially to 500 metres, then 100 metres by the end of the day as the freezing level gradually lowers.

Comments

Snowpack becoming icy and firm in many locations as the freezing level lowers.
