

Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Sat 07/02/2026 TO 18:00HRS Sun 08/02/2026

THE AVALANCHE HAZARD WILL BE LOW**Avalanche Hazard Forecast for Sunday 08/02/2026****Avalanche Problems****Wind Slab****Forecast Snow Stability & Avalanche Hazard**

Milder conditions with light rain at lower levels will moisten much of the snow. Higher slopes will remain firm possibly icy in places. Localised areas of windslab will exist in sheltered gullies and on slopes mainly above 1000 metres with a South-West through North-West to Northerly aspect. Gully exits and steep corrie rims will be most affected. Some fragile cornices may also exist in these areas. The avalanche hazard will be Low.

**Forecast Weather Influences**

Light falls of new snow will affect the higher slopes overnight and through Sunday. Winds will remain generally Easterly but veering Southerly later in the afternoon. Winds will be fresh to strong overnight but reducing through the day. The freezing level will be around 1300 metres overnight lowering to around 1100 metres later in the day.

Comments

Milder conditions overnight becoming cooler by day with light new snow on highest tops and light rain on lower slopes.
