

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 17/02/2026

Avalanche Problems

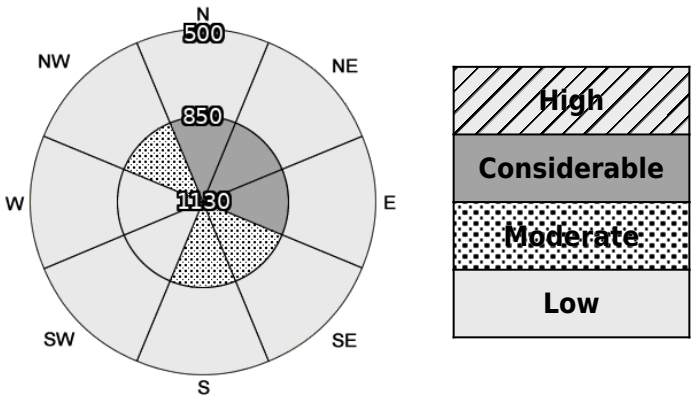

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Weaknesses within existing windslab will persist and fresh unstable accumulations will build, both in wind-sheltered terrain above 850 metres. Aspects most affected are North-West through North to South-East with isolated new windslab deposits on Southerly aspects later. Fragile cornices above the same aspects. Wind exposed slopes will be firm and icy with a fresh dusting of snow on top. The avalanche hazard will be Considerable.

Forecast Weather Influences

Overnight snow will clear to leave a dry and bright day. The freezing level will hover around 300 metres. Very strong West-North-Westerly winds will steadily veer North and decrease throughout the day to become light.

Comments

A couple of dry and bright days are forecast. Expect icy paths.
