Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Snowfall with redistribution of existing deposits will see new moderately to weakly bonded windslab developing on North-East through South-East to South-West aspects above 900 metres. Instabilities will also persist within deep deposits on West to North aspects. Gully tops, scarp slopes and corrie rims will be worst affected. Instabilities will be encountered at lower levels in steep sheltered terrain. Exposed slopes will be scoured and icy. The avalanche hazard will be Considerable.

Forecast Weather Influences

The freezing level is expected to be sub 500 metres throughout. Snowfall overnight but easing to give a bright day. Winds will be gale force from the North-West overnight, veering and easing during to become light Northerlies by afternoon.

Comments

Good snow cover, with a wider distribution of new unstable windslab developing overnight.
