

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Sunday 22/02/2026

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Throughout Sunday, there will be some light fresh snow on the higher summits, where small accumulations may build on North through to East aspects above 850 metres but amounts are not forecast to be significant. The existing snowpack will continue to thaw and consolidate. The largest areas of which can be found above 800 metres, on West, through North and East to South aspects. The avalanche hazard will be Low.

Forecast Weather Influences

Saturday evening will bring a few hours of rain to all levels. Throughout Sunday, there will be frequent showers of rain, with some sleet and snow on the highest tops. Winds will be strong to very strong, South-Westerly. Overnight the freezing level will be well above the summits but will lower to around summit level by early Sunday morning, and remain there throughout the day.

Comments

The thaw continues this evening, with slightly cooler temperatures on Sunday, most likely giving a dusting of snow at summit level. Freezing level is set to rise well above the summits on Monday and into Tuesday, accompanied by rain, with significant snow loss likely during this period.
