

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Monday 23/02/2026

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Surface layers will gradually firm up above 800 metres overnight, softening again later as the freezing level rises to the summits. Mostly well bonded, stable conditions. Shallow windslab will start to form in wind sheltered locations on North through East to South-East aspects, initially above 800m, later only above 1000m. New snow amounts are not expected to be significant and will start to consolidate as the freezing level rises. Cornices will be present. The avalanche hazard will be Low.

Forecast Weather Influences

Light snowfall overnight above 800 metres. By late morning precipitation will only fall as light snowfall above 1050 metres. Mainly dry afternoon. Winds will be variable, South-West to Westerly, strong throughout. 800 metre freezing level overnight, rising to 1200 metres by the end of the period.

Comments

Outlook is mild for the start of the week. Risk of large cornice collapse if the thaw becomes well established.
