

## THE AVALANCHE HAZARD WILL BE MODERATE

### Avalanche Hazard Forecast for Monday 23/02/2026

#### Avalanche Problems

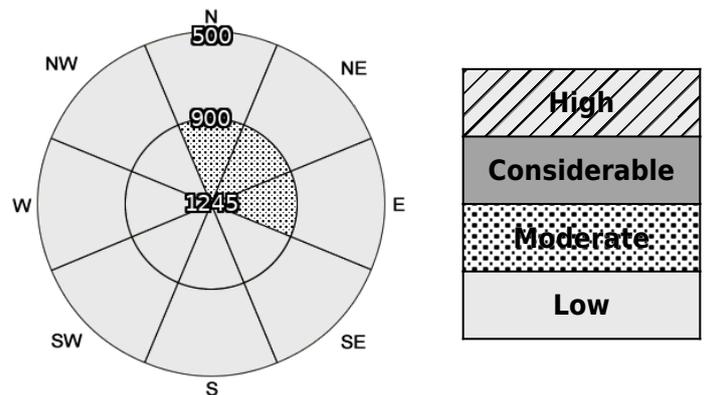

Wind Slab

Cornices

#### Forecast Snow Stability & Avalanche Hazard

Unstable windslab will continue to build primarily on North to East aspects above 900 metres. These deposits will be mostly confined to wind-sheltered locations such as gully tops and coire rims and will start to consolidate as the freezing level rises towards the end of the forecasting period. Fragile cornices will develop in the same areas. Elsewhere the snowpack will be mostly firm and stable, with the surface softening later in the period. The avalanche hazard will be Moderate.

#### Forecast Weather Influences

The freezing level will be 850 metres initially then rising steadily to 1200 metres by the end of the forecasting period. Precipitation throughout much of the time, with a brief respite on Monday afternoon. At first this will fall as snow to around 800 metres but latterly become confined to the highest summits. Very strong winds mostly from the West-South-West will decrease through the daytime to become fresh.

#### Comments

Freezing level rising above the summits through Monday evening allowing for a continuing thaw.
