

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Thursday 26/02/2026

Avalanche Problems

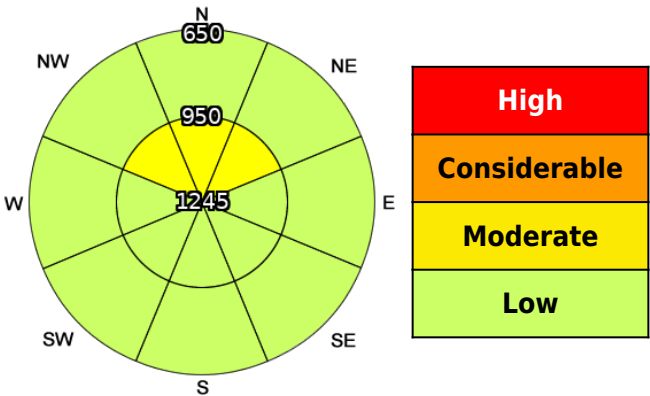

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

The majority of the snowpack will remain well bonded; however wet snow instabilities will increase, especially overnight on steep North-West to North-East aspects above 950 metres. On these aspects cornices will be prone to collapse. New accumulations of windslab will develop on wind sheltered North to East aspects above 1100 metres, but these will be isolated, shallow and avoidable. The avalanche hazard will be Moderate.

Forecast Weather Influences

Rain, at all levels, this will be heavy at times, and turn to snow just below summit levels mainly during the day. Strong South-Westerly winds will steadily increase to gale force and back to become South-South-Westerly during the day. During the morning the freezing level will fall to around 1100 metres before rising again in the afternoon.

Comments

Cornice collapse, rockfall and wet snow instabilities will be a potential hazard during the mild wet conditions.
