

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Thursday 26/02/2026

Avalanche Problems

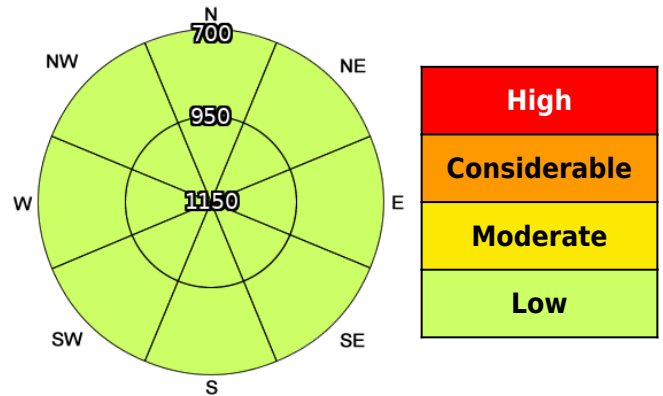

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Mild conditions with rain will further reduce the snow cover. Generally the snowpack will be soft and moist with reasonable stability. Wet snow instabilities will persist above 950 metres on steep ground in sheltered gullies and on slopes with a North-West through North to Easterly aspect. Gully exits and corrie rims will be most affected. Unstable cornices may also exist in these areas. The avalanche hazard will be Low.

Forecast Weather Influences

Rain heavy at times at all levels will continue to affect the area, slightly cooler conditions through the day may give a light cover of new snow on the highest tops but amounts are not expected to be significant. Winds will become strong through the day generally from the South-South-West. The freezing level will mainly lie above the Glen Coe summits with a very brief period at around 1000 metres.

Comments

Wet conditions overnight and for much of Thursday, Remaining generally unsettled with showers or longer spells of rain feeding in from the west. From Friday evening to Saturday evening a transient ridge of high pressure develops, giving a spell of drier weather, although some showers are still possible in the west.
