

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Friday 27/02/2026

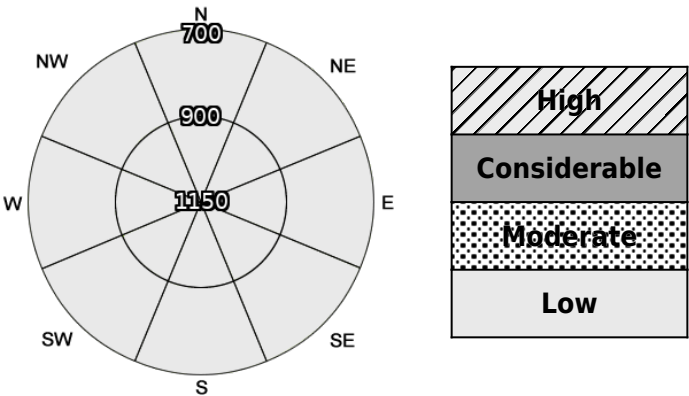

Avalanche Problems

Cornices

Forecast Snow Stability & Avalanche Hazard

As the freezing level drops the snow cover will start to refreeze, particularly around the higher tops. New accumulations will develop in wind sheltered locations, mainly on North-East to South-East aspects above 900 metres. These new deposits are expected to be shallow and generally inconsequential. Cornice and icefall collapse will initially remain a hazard, stability improving as the freezing level drops. The avalanche hazard will be Low.

Forecast Weather Influences

Becoming cooler with the freezing level dropping, expected to be around 900 metres most of the day, dropping to 800 metres by end of the afternoon. Light rain overnight, turning to snow as the freezing level drops. Strong South-Westerlies easing and veering to become light North-Westerlies by late afternoon.

Comments

Becoming cooler again with surface layers refreezing throughout the day. New snow expected to be light.
