

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Sunday 01/03/2026

Avalanche Problems

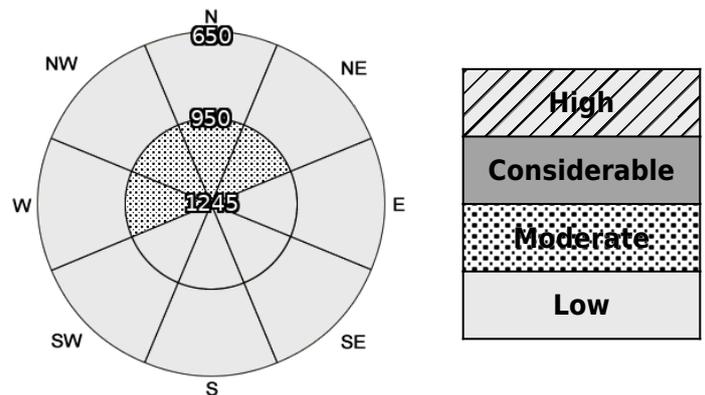

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Localised accumulations of unstable windslab will develop on West through North to North-East aspects above 950 metres. The greatest instability will be on steep wind sheltered locations such as coire rims and gully tops. On these aspects as it turns milder wet snow surface instabilities will develop and remaining cornices which mostly overhang North-West to Northerly aspects will become unstable. The avalanche hazard will be Moderate.

Forecast Weather Influences

Strong Southerly winds will increase to Gale force during the day. Occasional light snow showers will become heavier during the morning before turning to light rain at all levels by the end of the period. The 500 metre freezing level will steadily rise to 900 metres by dawn, then to above summit levels by the end of the day.

Comments

Very firm snow ice with serious run out potential on steep slopes. Cornices will become more unstable through the afternoon as the freezing level rises.
