

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Sunday 15/03/2026

Avalanche Problems

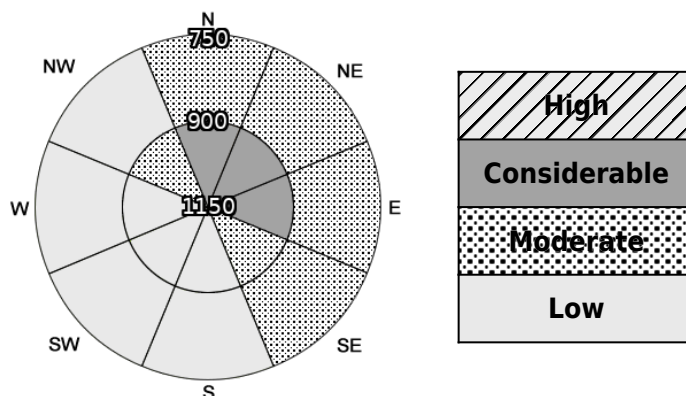

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Snowfall and drifting will form fresh unstable windslab in wind sheltered locations on North-West through North to Easterly aspects above 900 metres. Gully tops and sharply defined corrie rims will be most affected. Moderately bonded accumulations will be present just below this altitude. Fragile cornices will be present. Wind exposed locations will be scoured and icy. The avalanche hazard will be Considerable.

Forecast Weather Influences

Snowfall, arriving overnight, above 600 metres initially, will be heaviest after daybreak until mid-morning above 850 metres. The winds will be mainly strong South-South-Westerly, later veering West-South-Westerly. 600 metre freezing level overnight, rising briefly to 850 metres during the morning, lowering back down to 600 metres by the end of the afternoon.

Comments

Good crampon technique required on the firm old snow. Slips and trips could result in a long, high speed fall.
