

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 17/03/2026

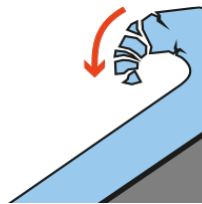

Avalanche Problems

Wind Slab

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Windslab will become moist with the onset of rain resulting in a transition from dry to wet snow instability. Areas affected will be North through North-East to South-East aspects above 950 metres. Steep slopes such as coire headwalls between 700 and 950 metres will also be affected. Cornices will be prone to collapse, triggering steep slopes below. Elsewhere, the snowpack will be moist and subject to slow consolidation. The avalanche hazard will be Considerable.

Forecast Weather Influences

Rain at all elevations is expected overnight and through much of the day. Winds will generally be from the South-South-West remaining storm force for the duration. The freezing level will remain well above the highest summits.

Comments

A period of instability as the freezing level rises well above the summits accompanied by rain. Later in the day a slowly consolidating trend will become established.
