

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 28/03/2026

Avalanche Problems

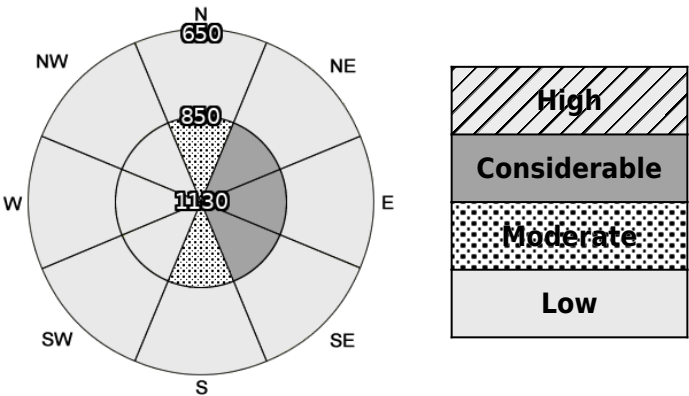

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Fresh accumulations of unstable windslab will develop primarily on North-East to South-East aspects above 850 meters. South and North aspects will also be affected due to cross-loading. Coire rims, gully tops and steep terrain where snow gains depth and overlies the old snow pack will be most affected. Fresh cornices will be fragile. Elsewhere, stability will be generally good. The avalanche hazard will be Considerable.

Forecast Weather Influences

Gale force West-South-West winds overnight will veer West-North-West by the end of the day. Scattered snow showers throughout the forecast period will be heavier in the early hours of the morning, lying to around 400m by end of day. The freezing level will be around 300-400 meters briefly rising to 600 metres early morning.

Comments

Challenging and serious winter conditions forecast for the summits.
