

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Friday 03/04/2026

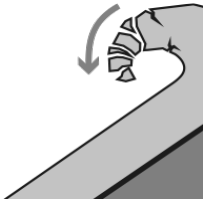

Avalanche Problems

Wind Slab

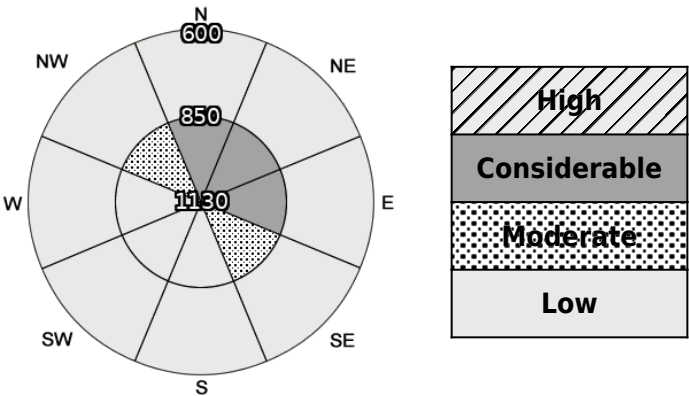

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Fresh deposits of unstable windslab will develop during the evening and overnight, mainly on North-West to North-East aspects above 850 metres. There will be a period of instability overnight as this windslab turns to wet snow. Stability in this snow will improve as the temperature lowers. However, there will be further accumulations of unstable windslab, mainly on North-East to South-East aspects above 850 metres. Cornices will be prone to collapse. The avalanche hazard will be Considerable.

Forecast Weather Influences

Southerly Gale force winds will veer Westerly early morning and become very strong through the day. Precipitation initially falling as snow above 600 metres will then turn to rain and sleet on the summits for a time overnight before further snow showers fall above 500 meters during the day. The freezing level will be around 800 metres then rise above the summits overnight, lowering to around 600 metres during the day.

Comments

A complex avalanche picture with fluctuating temperatures and significant amounts of new snow.
