

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Friday 03/04/2026

Avalanche Problems

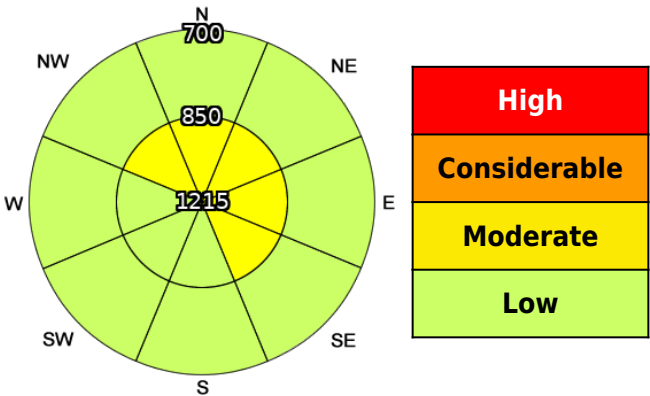

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

After a period of instability overnight, new windslab will be found mostly on North-West through North-East to South-East aspects above 850 metres. Wind sheltered features such as corrie rims, gully tops and crag aprons will be affected particularly where new accumulations have achieved depth over older snow-ice. Unstable cornices will also start to rebuild. The avalanche hazard will be Moderate.

Forecast Weather Influences

An approaching front will see some changeable conditions over the next period. Overnight there will be snowfall with the freezing level initially at 800 metres but lifting above the summits with precipitation turning to rain. By morning the freezing level is expected to be around 800 metres with light snowfall. Gale force winds throughout, Southerly overnight but veering to the West for most of the day.

Comments

A stormy and changeable period overnight. Old snow is very hard, slips or trips could have serious consequences.
