

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 04/04/2026

Avalanche Problems

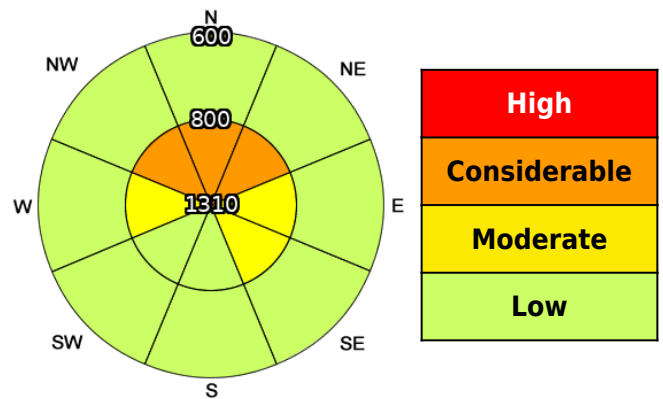

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Overnight localised unstable windslab will develop on North-East to South-East aspects above 800 metres. During the afternoon unstable windslab will become more widespread on North-West to North-East aspects above 800 metres. West aspects will be affected by cross loading. Areas most affected will be steep wind sheltered locations such as gully tops, coire rims and ridge flanks. Fresh cornices will be fragile. The avalanche hazard will be Considerable

Forecast Weather Influences

Snow showers during the night on gale force West-South-Westerly winds. Dry conditions expected during the morning followed by snow fall during the afternoon on fresh increasing to gale force South-Easterly winds. The 500 metre freezing level will steadily rise to 900 metres by the end of the forecast period.

Comments

Heaviest snowfall expected through Saturday afternoon, during this time the avalanche hazard will increase to Considerable.
