

Avalanche Hazard Forecast for Sunday 28/02/2010

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Little change. Buried very weak layers will persist under deep windslab deposits mainly on South-East through South to North-West aspects above 750m where avalanches will occur. Localised instability will also remain on other steep, sheltered locations where snow has recently accumulated. High hazard of avalanche.

Forecast Weather Influences

It will remain cold with overnight snow showers on strong North-East winds.

Comments

Very careful route choice required for high or low level back-country travel at present. Check our blog later this evening.
