

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Sunday 14/03/2010

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

New localised accumulations of weakly bonded windslab will develop mainly in sheltered areas on Easterly to Southerly aspects above 800 metres. Gully flanks and scarp slopes will also be affected by cross loading on other aspects. Elsewhere the old snowpack will remain well bonded and stable. The avalanche hazard will be Considerable.

Forecast Weather Influences

A dry night will be followed by prolonged snow showers on Sunday. The winds will be strong North-Westerlies with the freezing level lowering to 400 metres.

Comments

Very blustery in the hills today.
