

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 25/12/2010

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Snow showers and Westerly winds will contribute to re-distribution of snow to Easterly quarter aspects. Various weaknesses persist, possibly buried surface hoar, faceted grains and easily failing firm slab on soft layers. Above 750 metres on North-East to Southerly aspects, avalanches are likely on steep, convex terrain. The avalanche hazard will be Considerable.

Forecast Weather Influences

There will be snow showers overnight with moderate winds from the West. Temperatures will be slightly warmer but still below freezing at all elevations.

Comments

Hard neve on low angle terrain requires crampon care. Steep convex exit slopes require extra special avalanche route finding care.
