

Avalanche Hazard Forecast for Sunday 26/12/2010

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Stability will steadily decline during the day as winds re-distribute snow as windslab on to North-West through North to Easterly aspects above 800m where avalanches are likely. Slopes and gully tops directly exposed to the wind will show better stability. Considerable hazard of avalanche.

Forecast Weather Influences

Dry and cold overnight with much stronger Westerly, later Southerly, winds during Sunday. Light snowfall during the day with heavier falls expected later in the period.

Comments

Reasonable stability to start but declining rapidly as wind speeds increase - significant transport of snow expected later in the day.
