

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Sunday 23/01/2011

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Little change; the snowpack will continue to slowly consolidate and stabilise. Localised instabilities only are expected where steepest unsupported deposits exist high in North through East to South aspects and steep gully flanks above 900 metres. The avalanche hazard will be Moderate.

Forecast Weather Influences

Another dry day with light to moderate North-West winds is expected. The freezing level will be around summit level.

Comments

Some large cornices still around coire rims
