

Avalanche Hazard Forecast for Tuesday 29/03/2011

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Good stability in most locations. Some thin moist windslab possible on a few steep North West through North to East aspects above 950m but this will be localised. Falling ice and cornices will still threaten slopes below with high additional loading. Moderate hazard of avalanche.

Forecast Weather Influences

Cooler and dry overnight then some sleety snow showers during the day. Freezing level rising to above summits later. Winds will be light to moderate Westerly, later South-Easterly.

Comments

Falling cornices, ice and rocks remain potential hazards.
