

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Wednesday 28/12/2011

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The old much depleted snowpack is now consolidated and stable. New windslab accumulations will develop in high sheltered, mostly North-East to East aspects above 800 metres, with some cross-loading onto steep gully flanks and exits. New snow instabilities are expected where accumulations develop and acquire depth. The avalanche hazard will be Moderate

Forecast Weather Influences

Heavy rain will lead to scattered snow showers as freezing levels lower from 1500 metres overnight to 700 metres during the day. Winds will be South-West becoming Westerly and increasing moderate to strong.

Comments

Little bit cooler but a big improvement needed in conditions for winter fun to resume.
