

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 17/01/2012

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The snowpack will start to soften and moisten as the milder conditions affect the area. General stability will remain good but wet snow instabilities will start to form on the steepest slopes and gullies as sleet or rain becomes more persistent through the day. Areas most affected will be sheltered gullies and slopes with Northerly to South-Eastly aspect above 850 metres. The avalanche hazard will be Moderate.

Forecast Weather Influences

Becoming milder. Mainly dry conditions overnight will give way to a period of sleet followed by moderate rain which will become more persistent by afternoon. Winds will be strong to gale force Southerly.

Comments

An unsettled South-Westerly airstream will become established on Tuesday. Hazard of falling rocks dislodged by thaw conditions will exist.
