

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 06/03/2012

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Modest quantities of new precipitation will develop isolated pockets of fresh windslab in sheltered gully exits and steep gully flanks above 900 metres. Some transitional instabilities will exist in these steepest mostly North-East through East to South-East aspects, as snow turns to rain late in the period. The avalanche hazard will be Moderate

Forecast Weather Influences

Remaining dry and cool overnight before outbreaks of snow after midday turn to rain as the freezing level rises to just above the summits. Winds initially North-West will strengthen to become strong South-Westerly.

Comments

Fluctuating temperatures and poor hill prospects for Tues with rain and strong winds - once again!
