

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Wednesday 30/01/2013

Avalanche Problems

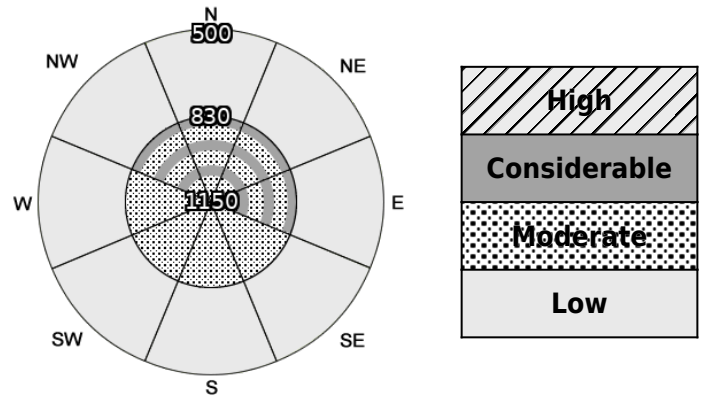

Wind Slab

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

New deposits of windslab will form in sheltered locations mainly on North to East aspects above 900 metres. Where new accumulations overlie the existing melt freeze icy crust, bonding will be poor. Elsewhere the snowpack will be generally well bonded. The avalanche hazard will be Considerable.

Forecast Weather Influences

Moderate snow showers through the period, less frequent in the day with strong Southerly winds these will veer to the West. The freezing level will lower from 1200 metres to 800 metres.

Comments

Above 800 metres areas scoured by the wind will be firm and icy.
