

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 09/02/2013

Avalanche Problems

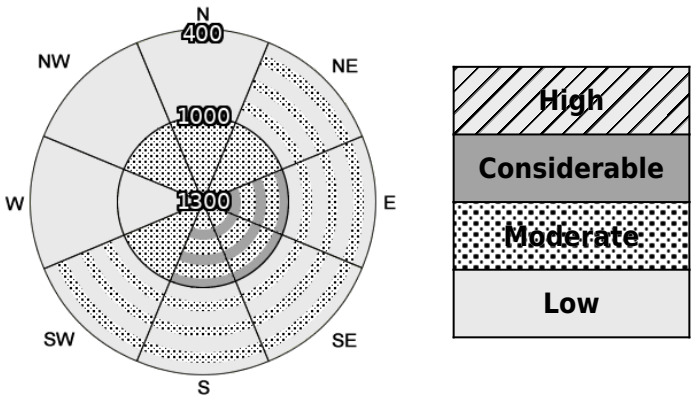

Wind Slab

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Localised weaknesses will remain within the snowpack mostly in steep convex terrain on East to South aspects above 1000 metres. Some drifting at higher altitudes will lead to new accumulations of windslab developing. Gully tops scarp slopes and corrie rims will be affected on North-West to North-East facing slopes. Lower altitudes will generally be more stable with localised instabilities remaining in steep locations. The avalanche hazard will be Considerable.

Forecast Weather Influences

It is expected to be dry and moderate West winds will back to the South. The freezing level will rise to 900 metres overnight, then fall to 800 metres during the day.

Comments

Good winter conditions at present
