

THE AVALANCHE HAZARD WILL BE MODERATE**Avalanche Hazard Forecast for Sunday 10/02/2013****Avalanche Problems****Forecast Snow Stability & Avalanche Hazard**

Overnight, some new localised accumulations of shallow windslab instabilities may develop in sheltered locations, mainly on North-West to North-East aspects above 900 metres. The older, moist snowpack will re-freeze and will be generally well bonded and stable on all aspects and elevations. The avalanche hazard will be Moderate.

**Forecast Weather Influences**

A few, light sleet or snow showers tonight, but mostly dry conditions are expected through the day, the winds will be strong, South-Easterly. The freezing level lowering to 400 metres and summit temperatures expected to be around minus 2 degrees Celsius.

Comments

A cold, showery East or South-Easterly airflow will become established during Sunday, this will improve climbing conditions. High pressure will bring drier but still colder weather later Monday and Tuesday.
