

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Sunday 24/02/2013

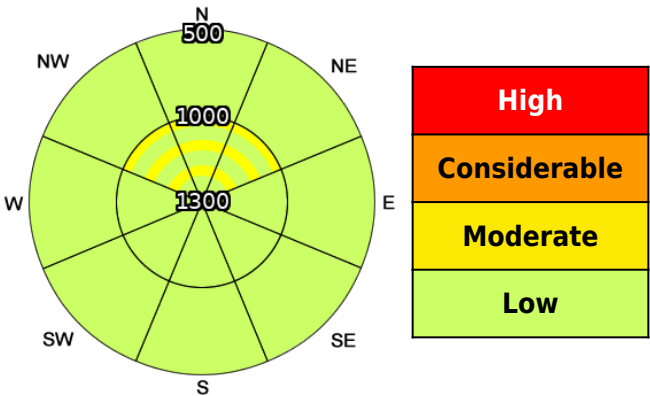

Avalanche Problems

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Little change expected within the snowpack; In general the old snowpack will be firm, well bonded and stable throughout. The weak faceted layer will persist beneath the strong surface crust mainly affecting steep and convex terrain on North-West to North-East aspects above 1000 metres. The avalanche hazard will be Moderate.

Forecast Weather Influences

High pressure developing. Light East then North-East winds with perhaps the odd snow flurry. Freezing at all levels overnight then rising to 450 metres during the day.

Comments

Dry faceted layer below surface crust still developing in the cold temperatures.
