

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 26/02/2013

Avalanche Problems

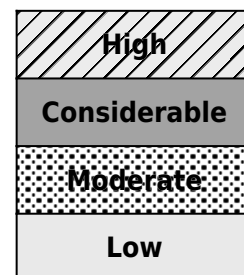

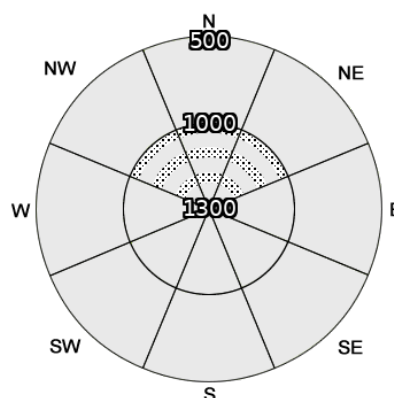

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

In general the old snowpack will remain firm well bonded and stable throughout with small pockets of avoidable windslab lying on North-West to North-East aspects above 950 metres, also on these aspects localised instabilities will affect steep convex terrain due to the weak faceted layer beneath the surface crust mostly above 1000 metres. Cornices weakening on sun exposed slopes. The avalanche hazard will be Moderate.

Forecast Weather Influences

High pressure; light Southerly winds with no precipitation. The freezing level will rise to 1600 metres during the day.

Comments

Localised instabilities due to developing weak faceted layer beneath surface crust, which in places cracks and gives way underfoot.
