

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 06/04/2013

Avalanche Problems

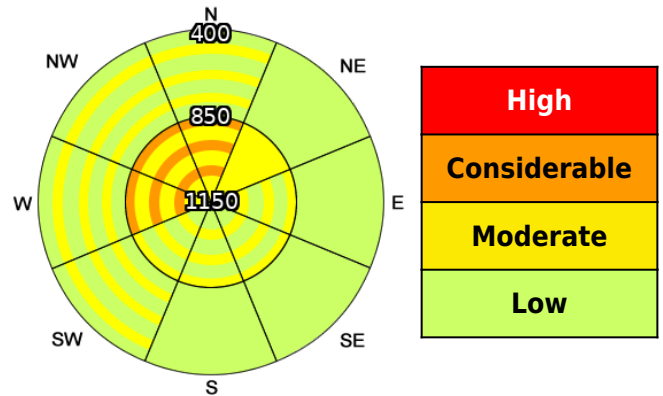

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

Areas of instability are slowly becoming more localised as some consolidation is slowly taking place during the warming trend. However, buried weakly bonded layers will persist particularly on shaded, steeper slopes on West to North aspects mainly above 850m. The avalanche hazard will be Considerable.

Forecast Weather Influences

It should remain generally dry and cold, the light Northerly winds will become Westerly. After another overnight frost the freezing level will rise to around 600 metres.

Comments

Summit temperatures around minus four degrees Celsius. Some cornices are starting to be affected by solar warming. Collapse was noted today on North-East to South-East slopes causing the slopes below to sluff.
