

**THE AVALANCHE HAZARD WILL BE HIGH**

**Avalanche Hazard Forecast for Monday 23/12/2013**

**Avalanche Problems**

**Wind Slab**

**Persistent Weak Layers**

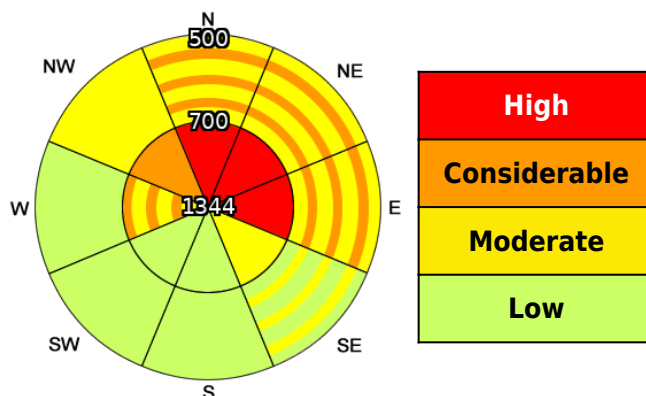

**Wet Snow**

**Cornices**

**Forecast Snow Stability & Avalanche Hazard**

Overnight further unstable windslab will be added to the already significant accumulations on North to East aspects and other sheltered locations above 700 metres. North-West and West aspects will become increasingly affected through the day. Stability will further decrease through the afternoon as the temperature rises, and avalanches will occur where significant accumulations have developed. Cornices will be prone to collapse. The avalanche hazard will be High.

**Forecast Weather Influences**

Overnight snow showers are expected to die out through the morning. Further snow, which will turn to rain at lower levels as the freezing level rises to 1000 metres, is expected during the afternoon. South-Westerly winds will back to the South-East and strengthen during the afternoon.

**Comments**

I suspect that avalanches did occur today, but with poor visibility they were not observed. Another wild day expected tomorrow.
