

THE AVALANCHE HAZARD WILL BE HIGH

Avalanche Hazard Forecast for Sunday 26/01/2014

Avalanche Problems

Wind Slab

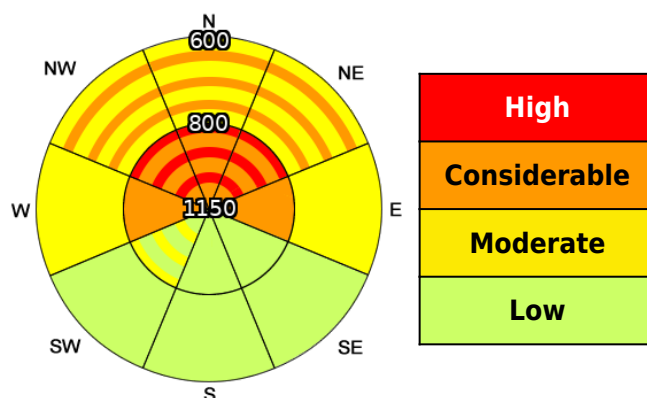

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

There will be a rapid build up of weakly bonded windslab throughout the day mostly in very sheltered locations on North-West to North-East aspects above 800 metres. Here avalanches will occur, some of which will have potentially long run outs. Other aspects will also be affected due to cross loading. Any aspects exposed to the wind will be scoured and stable. Fragile new cornices will reform. The avalanche hazard will be High.

Forecast Weather Influences

After a largely dry night there will be significant new snow throughout the day from above 400 metres. Winds will strengthen to gale force from the South-East and South.

Comments

Likely to be a day of blizzards and white out's.
