

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 04/02/2014

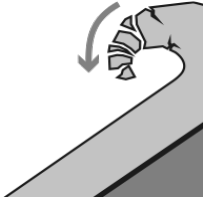

Avalanche Problems

Wind Slab

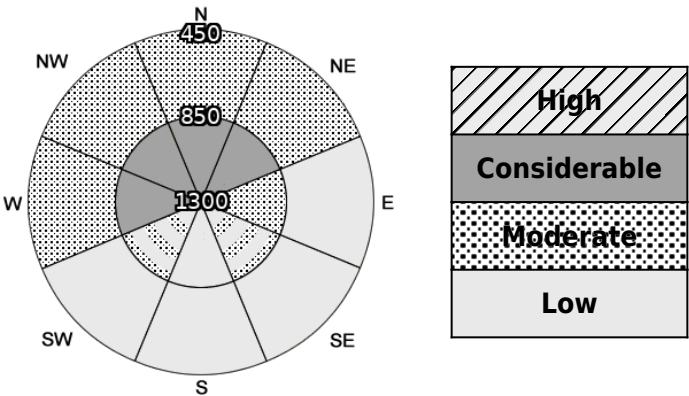

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

Unstable windslab will be present on mainly West through North to North-Easterly aspects above 850 metres, where avalanches are likely, with unstable accumulations on other aspects due to cross loading. Steep lee slopes, gullies, corrie rims and scarp slopes most affected. Elsewhere the snowpack will generally refreeze and stabilise. With many areas scoured. Cornices are large and prone to collapse. The avalanche hazard will be Considerable

Forecast Weather Influences

Winds will be strong South-South-Easterly becoming Southerly in the day lessening slightly in strength. Some snow is expected overnight mainly above 700 metres. During the day it will get colder with a freezing level around 500 metres.

Comments

A short respite tuesday but more storm force winds wednesday with precipitation expected.
