

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Wednesday 12/02/2014

Avalanche Problems

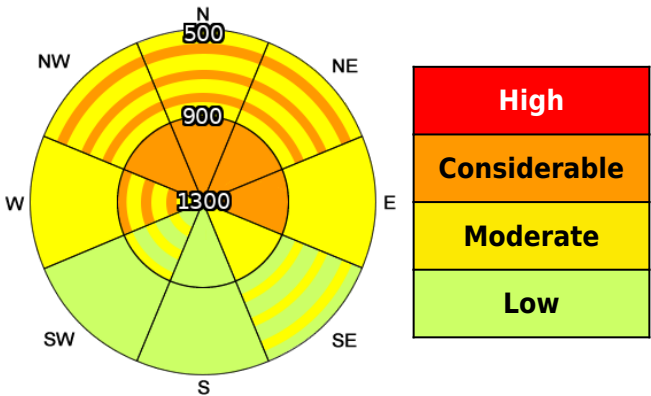

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Unstable windslab will continue to build on mainly North-Westerly through North to Easterly facing slopes above 900 meters where avalanches are likely. Gullies, corrie rims and scarp slopes especially affected. Below this level the snowpack will be varied with localised poorly bonded accumulations forming in hollows and on steep banks with many areas firm and stable also. Cornices will be weak. The avalanche hazard will be Considerable

Forecast Weather Influences

Light snow showers overnight, generally dry during the day but with heavier snow falling late afternoon. It will be a cold day, freezing at all levels then 600 metres or so later in the day. Winds will be strong South-Westerly overnight backing very strong South-Easterly during the morning.

Comments

Another stromy period will begin to arrive in the afternoon
